How it works?

Emmi-pet, with its unique and patented dental care system is now setting a new trend for a completely new kind of dental cleaning and oral hygiene. It is gentle, motionless and does not involve brushing or any abrasive action!

This revolutionary method is based on a globally unique patent – the Ultrasonic Piezo-Chip created by Emmi-dent. This Piezo-Chip sits in the head of the ultrasonic toothbrush and generates up to 96 million ultrasonic waves (air vibrations) per minute.

These ultrasound waves are then transferred, via the bristles of the toothbrush head, onto Emmi-pets specially formulated toothpaste.

At this point, 'micro bubbles' are generated which react with the air vibrations and implode. These implosions effectively eliminate and remove food particles, plaque and bacteria from within your pets mouth.

Emmi-pet effectively combats:

*Gingivitis and periodontitis
Oral cavity disease
Plaque and tartar build up
Bad breath*
